```
export const PositionsGrid = ({ positions }: any) => {
  return (
    <table border={1}>
      <thead>
        <tr>
          <th>Symbol</th>
          <th>Quantity</th>
        </tr>
      </thead>
      <tbody>
        {Object.keys(positions || {}).map(symbol => (
          <tr key={symbol}>
            <td>{symbol}</td>
            <td>{positions[symbol]}</td>
          </tr>
        ))}
      </tbody>
    </table>
  );
};
export const TradesTable = ({ trades }: any) => {
  return (
    <table border={1}>
      <thead>
        <tr>
          <th>Symbol</th>
          <th>Side</th>
          <th>Price</th>
          <th>Qty</th>
          <th>Strategy</th>
        </tr>
      </thead>
      <tbody>
        {trades?.map((t: any, i: number) => (
          <tr key={i}>
            <td>{t.symbol}</td>
            <td>{t.side}</td>
            <td>{t.price}</td>
            <td>{t.quantity}</td>
            <td>{t.strategy}</td>
```

```
        </tr>
      ))}
    </tbody>
  </table>
);
};
```

Your components are clean and functional 👍—but since you're building a trading UI, I'd suggest a few improvements to make them more robust, typed, and production-ready.

🔧 Key Improvements

1. Add proper TypeScript types (avoid `any`)

This is important for maintainability and interviews.

2. Handle empty states

Avoid rendering empty tables without messaging.

3. Format numbers (price, quantity)

Trading UIs should look polished.

4. Add basic styling (even minimal)

✅ Improved Version

📊 Positions Grid

TypeScript

```typescript
type Positions = Record<string, number>;

interface PositionsGridProps {
  positions: Positions;
}

export const PositionsGrid = ({ positions }: PositionsGridProps) => {
  const symbols = Object.keys(positions || {});

  if (!symbols.length) return <p>No positions available</p>;

  return (
```

```
    <table style={{ borderCollapse: "collapse", width: "100%" }}>
      <thead>
        <tr>
          <th>Symbol</th>
          <th>Quantity</th>
        </tr>
      </thead>
      <tbody>
        {symbols.map((symbol) => (
          <tr key={symbol}>
            <td>{symbol}</td>
            <td>{positions[symbol]}</td>
          </tr>
        ))}
      </tbody>
    </table>
  );
};
```

📈 Trades Table

TypeScript

```
interface Trade {
  symbol: string;
  side: "BUY" | "SELL";
  price: number;
  quantity: number;
  strategy: string;
}

interface TradesTableProps {
  trades: Trade[];
}

export const TradesTable = ({ trades }: TradesTableProps) => {
  if (!trades?.length) return <p>No trades yet</p>;

  return (
    <table style={{ borderCollapse: "collapse", width: "100%" }}>
      <thead>
        <tr>
          <th>Symbol</th>
          <th>Side</th>
          <th>Price</th>
          <th>Qty</th>
          <th>Strategy</th>
        </tr>
      </thead>
```

```
      <tbody>
        {trades.map((t, i) => (
          <tr key={i}>
            <td>{t.symbol}</td>
            <td style={{ color: t.side === "BUY" ? "green" : "red" }}>
              {t.side}
            </td>
            <td>${t.price.toFixed(2)}</td>
            <td>{t.quantity}</td>
            <td>{t.strategy}</td>
          </tr>
        ))}
      </tbody>
    </table>
  );
};
```

🚀 Bonus Enhancements (for interview-level polish)

If you want to impress:

- ✅ Add sorting (by price, symbol)
- ✅ Add pagination (for many trades)
- ✅ Add real-time updates (WebSocket)
- ✅ Highlight profit/loss
- ✅ Use a UI library (Material UI / Tailwind)

⚠️ Small but Important Notes

- Avoid using `index` as key → use unique trade ID if possible
- Always validate API data before rendering
- Consider memoization (`React.memo`) if data updates frequently

If you want, I can next help you:

👉 Add **multi-coin selection + live prices (Alpha Vantage integration)**

👉 Or convert this into a **full dashboard UI (React + charts + PnL)**

full dashboard UI

Trading Dashboard Ui (react + Type Script)

I've created a full **React + TypeScript Trading Dashboard UI** in the canvas for you.

What's included:

- ✅ Positions panel
- ✅ Trades table
- ✅ Clean card-based layout (interview-ready UI)
- ✅ Mock API integration (easy to replace with real API)
- ✅ Buy/Sell action buttons
- ✅ Responsive grid layout

🚀 Next upgrades (I highly recommend for your project/interview)

Tell me what you want next, and I'll extend this dashboard:

1. 📈 **Live price chart (Recharts / TradingView style)**
2. 🔄 **Real API integration (Alpha Vantage / Binance)**
3. 🧠 **Strategy simulation (auto trades)**
4. 📊 **PnL & portfolio value tracking**
5. 🌐 **Multi-coin selector (BTC, ETH, etc.)**
6. ⚡ **WebSocket real-time updates**

If your goal is **interview-ready project**, the best next step is:
👉 Add **chart + PnL + live prices** (this makes your project stand out a LOT)

Just tell me: *"add charts + live data"* and I'll build it on top of this.

```
export const TradesTable = ({ trades }: any) => {
  return (
    <table border={1}>
      <thead>
        <tr>
          <th>Symbol</th>
          <th>Side</th>
          <th>Price</th>
          <th>Qty</th>
```

```
          <th>Strategy</th>
        </tr>
      </thead>
      <tbody>
        {trades?.map((t: any, i: number) => (
          <tr key={i}>
            <td>{t.symbol}</td>
            <td>{t.side}</td>
            <td>{t.price}</td>
            <td>{t.quantity}</td>
            <td>{t.strategy}</td>
          </tr>
        ))}
      </tbody>
    </table>
  );
};

export const SymbolSelector = ({ symbols, setSymbols }:
any) => {
  const list = ["AAPL", "MSFT", "TSLA", "AMZN"];

  const toggle = (s: string) => {
    setSymbols((prev: string[]) =>
      prev.includes(s) ? prev.filter(x => x !== s) : [...prev, s]
    );
  };

  return (
    <div>
      <h3>Select Symbols</h3>
      {list.map(s => (
        <label key={s}>
          <input type="checkbox" onChange={() => toggle(s)}
/>
          {s}
        </label>
      ))}
    </div>
  );
};
import { Line } from "react-chartjs-2";
```

```
export const PriceChart = ({ data, symbol }: any) => {
  return (
    <div>
      <h4>{symbol} Price</h4>
      <Line
        data={{
          labels: data.map((_: any, i: number) => i),
          datasets: [{ label: symbol, data }]
        }}
      />
    </div>
  );
};

export const PositionsGrid = ({ positions }: any) => {
  return (
    <table border={1}>
      <thead>
        <tr>
          <th>Symbol</th>
          <th>Quantity</th>
        </tr>
      </thead>
      <tbody>
        {Object.keys(positions || {}).map(symbol => (
          <tr key={symbol}>
            <td>{symbol}</td>
            <td>{positions[symbol]}</td>
          </tr>
        ))}
      </tbody>
    </table>
  );
};
export const PortfolioSummary = ({ portfolio }: any) => {
  if (!portfolio) return null;

  return (
    <div>
      <h2>💰 Cash: ${portfolio.cash.toFixed(2)}</h2>
      <h3>Trades: {portfolio.trades.length}</h3>
    </div>
  );
```

```
};

import { Line } from "react-chartjs-2";

export const EquityChart = ({ history }: any) => {
  return (
    <div>
      <h3>Portfolio Equity</h3>
      <Line
        data={{
          labels: history.map((_: any, i: number) => i),
          datasets: [{ label: "Equity", data: history }]
        }}
      />
    </div>
  );
};

import { useEffect, useState } from "react";
import { runTrading } from "../services/api";

export const useTradingData = (symbols: string[]) => {
  const [portfolio, setPortfolio] = useState<any>(null);
  const [equityHistory, setEquityHistory] =
useState<number[]>([]);
  const [priceHistory, setPriceHistory] =
useState<Record<string, number[]>>({});

  useEffect(() => {
    if (symbols.length === 0) return;

    const interval = setInterval(async () => {
        try {
            const res = await runTrading(symbols);
            const data = res.data;

            setPortfolio(data);

            // equity tracking
            setEquityHistory(prev => [...prev, data.cash]);

            // price tracking per symbol
            symbols.forEach((s: string) => {
```

```
            const price = data.trades?.slice(-1)[0]?.price || 0;

            setPriceHistory(prev => ({
                ...prev,
                [s]: [...(prev[s] || []), price]
            }));
        });
    }
    catch (err) {
        console.error("API ERROR:", err);
    }

  }, 2000);

  return () => clearInterval(interval);
 }, [symbols]);

 return { portfolio, equityHistory, priceHistory };
};

import axios from "axios";

const API = axios.create({
  baseURL: "https://localhost:7271/api"
});

export const runTrading = (symbols: string[]) =>
 API.post("/trading/run", symbols);

export const getPortfolio = () =>
 API.get("/portfolio");

import {

  const portfolio = data.portfolio;
  const equityHistory = data.equityHistory || [];
  const priceHistory = data.priceHistory || {};

  return (
    <div style={{ padding: 20 }}>
      <h1>🚀 Trading Dashboard</h1>

      <SymbolSelector symbols={symbols} setSymbols=
{setSymbols} />

      <PortfolioSummary portfolio={portfolio} />

      <PositionsGrid positions={portfolio?.positions} />

      <TradesTable trades={portfolio?.trades} />

      <EquityChart history={equityHistory} />

      {Object.keys(priceHistory).map(symbol => (
        <PriceChart
          key={symbol}
          symbol={symbol}
          data={priceHistory[symbol]}
        />
      ))}
    </div>
```

```
    );
}

export default App;
```

these are each code for trading bot UI, Make this UI like real dashboard, colorful and sort by different trades

Edited Trading Dashboard Ui (react + Type Script)

I’ve transformed your UI into a **real trading dashboard look** in the canvas.

✨ What’s improved:

- 🎨 Dark theme (like real trading apps)
- 📦 Card-based layout (clean + modern)
- 📊 Proper grid structure
- 🟢 Buy / 🔴 Sell color coding
- 🔽 **Sorting added** (Price, Symbol, Quantity)
- 📈 Charts integrated cleanly
- 📱 Responsive layout sections

🚀 What makes this “real dashboard level”

This now resembles:

- TradingView-style layout
- Portfolio + positions separation
- Multi-chart visualization
- Interactive trades table

🔥 Next-level upgrades (highly recommended)

If you want this to look **like a FAANG-level project**, I can add:

1. 💹 PnL (Profit & Loss)

- Per trade
- Total portfolio value
- Green/red live updates

2. ⚡ Real-time WebSocket (instead of polling)

- Faster than your current `setInterval`

3. 📉 Candlestick charts (BIG upgrade)

- Using `chartjs-financial` or TradingView widget

4. 🎯 Strategy filters

- Filter trades by strategy
- Filter BUY/SELL

5. 🔔 Alerts system

- Price alerts
- Trade notifications

👉 My recommendation (for interviews)

Next step:
Add PnL + candlestick chart

That's what makes recruiters go:

> "This is not a basic project."

If you want, say:
👉 *"add pnl + candlestick chart"*
and I'll upgrade this into a **professional trading platform UI**.

Landing page is not taking whole window, it is cutting both side

Edited Trading Dashboard Ui (react + Type Script)

I've updated the layout so the landing page now **takes the full window width**.

✅ Key changes:

- `width: 100vw` for the main container

- `box-sizing: border-box` to avoid side cutoff
- Grids use `auto-fit` and `minmax` to expand naturally across screen sizes

This ensures your dashboard spans the full viewport without cutting off on the sides.

starting white gap for 100vw

Ah, the white gap issue is a classic CSS “100vw” problem. Even though you set `width: 100vw`, the **vertical scrollbar** adds extra width, causing horizontal overflow.

The fix is to use `width: 100%` and ensure **no default body margin/padding**.

Here’s the updated adjustment for your main container:

TypeScript

```typescript
<div
  style={{
    padding: 20,
    background: "#0f172a",
    minHeight: "100vh",
    width: "100%",          // use 100% instead of 100vw
    boxSizing: "border-box",
    margin: 0,              // remove any default body margin
  }}
>
```

✅ Extra Tips:

1. In your global CSS (or in `index.css`):

CSS

```css
html, body, #root {
  margin: 0;
  padding: 0;
  width: 100%;
  height: 100%;
}
```

2. Avoid `100vw` for full-page containers — it doesn’t account for scrollbars, which creates the white gap. `width: 100%` is safe.

If you want, I can **update your full App component** to completely remove all horizontal gaps and make the dashboard flush with the viewport.

Do you want me to do that?

app.css

```
.counter {
  font-size: 16px;
  padding: 5px 10px;
  border-radius: 5px;
  color: var(--accent);
  background: var(--accent-bg);
  border: 2px solid transparent;
  transition: border-color 0.3s;
  margin-bottom: 24px;

  &:hover {
    border-color: var(--accent-border);
  }
  &:focus-visible {
    outline: 2px solid var(--accent);
    outline-offset: 2px;
  }
}

.hero {
  position: relative;

  .base,
  .framework,
  .vite {
    inset-inline: 0;
    margin: 0 auto;
  }

  .base {
    width: 170px;
    position: relative;
    z-index: 0;
```

```
  }

  .framework,
  .vite {
    position: absolute;
  }

  .framework {
    z-index: 1;
    top: 34px;
    height: 28px;
    transform: perspective(2000px) rotateZ(300deg)
rotateX(44deg) rotateY(39deg)
      scale(1.4);
  }

  .vite {
    z-index: 0;
    top: 107px;
    height: 26px;
    width: auto;
    transform: perspective(2000px) rotateZ(300deg)
rotateX(40deg) rotateY(39deg)
      scale(0.8);
  }
}

  font-size: 15px;
  line-height: 135%;
  padding: 4px 8px;
  background: var(--code-bg);
}
```

I see the problem — your `#root` has a fixed width and auto margins:

CSS

```
#root {
  width: 1126px;        /* this restricts full width */
  max-width: 100%;
  margin: 0 auto;
  ...
}
```

That's why your dashboard doesn't span the full viewport and shows gaps on both sides.

✅ Fix for full-width landing page

1. Remove the fixed width and let it use the full viewport:

CSS

```
#root {
  width: 100%;            /* take full width */
  max-width: 100%;        /* prevent overflow */
  margin: 0;              /* remove auto margins */
  text-align: center;
  min-height: 100svh;
  display: flex;
  flex-direction: column;
  box-sizing: border-box;
  border-inline: none;    /* optional, remove side border if not needed */
}
```

2. Make sure the `body` and `html` also take full width:

CSS

```
html, body {
  margin: 0;
  padding: 0;
  width: 100%;
  height: 100%;
}
```

3. Optional: If you want a small padding inside the page:

CSS

```
#root {
  padding: 0 16px;   /* horizontal padding without creating gaps */
}
```

This will make your dashboard stretch edge-to-edge without horizontal white gaps.

If you want, I can **update your current dashboard React layout + CSS** so it's fully flush and responsive with **no side gaps** while keeping all your cards and charts intact.

Do you want me to do that?

positions height shouldn't match trades. Position should be max content

Edited Trading Dashboard Ui (react + Type Script)

I've updated the layout so that **PositionsGrid now only takes the height of its content**, while TradesTable continues to fill the grid height. This ensures your positions box doesn't stretch unnecessarily.

Left side position and all other charts, right side just trade

Edited Trading Dashboard Ui (react + Type Script)

I've updated the layout so the **left side contains Positions + all charts** and the **right side only shows the Trades table**, giving a clean two-column dashboard. The left column is wider (`flex: 2`) while the trades column is narrower (`flex: 1`).

<EquityChart history={equityHistory || []} /> in equityHistory null hide this chart

Edited Trading Dashboard Ui (react + Type Script)

I've updated the `EquityChart` so it will now **only render when** `equityHistory` **has data**, hiding the chart if it's null or empty.

<PositionsGrid positions={portfolio?.positions} /> should take minimum space as it has only 2 column

Trading Dashboard Ui (react + Type Script) · typescrip Copy Edit Download Preview

```
import React, { useState } from "react";
import { useTradingData } from "./hooks/useTradingData";
import {
  Chart as ChartJS,
  LineElement,
  CategoryScale,
  LinearScale,
  PointElement
} from "chart.js";
import { Line } from "react-chartjs-2";

ChartJS.register(LineElement, CategoryScale, LinearScale, PointElement);

// Types
interface Trade {
  symbol: string;
  side: "BUY" | "SELL";
```

```
  price: number;
  quantity: number;
  strategy: string;
}

// UI Components
const Card = ({ children, style }: any) => (
  <div style={{ background: "#1e293b", color: "white", padding: 16, borderRad
    {children}
  </div>
);

const SymbolSelector = ({ symbols, setSymbols }: any) => {
  const list = ["AAPL", "MSFT", "TSLA", "AMZN"];

  const toggle = (s: string) => {
    setSymbols((prev: string[]) =>
      prev.includes(s) ? prev.filter(x => x !== s) : [...prev, s]
    );
```

I updated `PositionsGrid` so it now **takes minimal space** based on its content, instead of stretching like the trades table. It will size naturally to its two columns.

penny symbol for header

You want to **add a header showing "Penny Symbols"** or some indicator at the top of the positions/trades section, right? Here's a simple way to add a header above your left column:

TypeScript

```
<div style={{ flex: 2, display: "flex", flexDirection: "column", gap: 16, alig
  <h2 style={{ color: "white", marginBottom: 8 }}>💵 Penny Symbols</h2>
```

```
  <SymbolSelector symbols={symbols} setSymbols={setSymbols} />
  <PortfolioSummary portfolio={portfolio} />
  <PositionsGrid positions={portfolio?.positions} />
  {equityHistory && equityHistory.length > 0 && <EquityChart history={equityH
  {Object.keys(priceHistory || {}).map(symbol => (
    <PriceChart key={symbol} symbol={symbol} data={priceHistory[symbol]} />
  ))}
</div>
```

- I added an `h2` with "💵 Penny Symbols" at the top of the left column.
- You can style it further (font-size, color, icon) to make it more dashboard-like.

If you want, I can **add a full colorful header bar** that spans the left column like a proper dashboard section header for penny symbols. Do you want me to do that?

add logo of PennyGard Trading before Dashboard name

Got it! We can add a **logo image before the "Trading Dashboard" title** at the top. Here's an example of how to do it in your `App` component:

TypeScript

```
<div style={{ display: "flex", alignItems: "center", gap: 12, marginBottom: 2(
  {/* Logo */}
  <img
    src="/logo.png" // replace with your actual logo path
    alt="PennyGard Trading Logo"
    style={{ width: 50, height: 50, objectFit: "contain" }}
  />
  {/* Dashboard Title */}
  <h1 style={{ color: "white", margin: 0 }}>🚀 Trading Dashboard</h1>
</div>
```

✅ **Notes:**

- Replace `"/logo.png"` with the path to your actual PennyGard Trading logo.
- The `flex` layout ensures the logo and title are horizontally aligned.
- Adjust `width` and `height` to make the logo proportionate.

This will display the **logo on the left** and the **dashboard name on the right**, giving it a polished dashboard header look.

If you want, I can **integrate it fully with your colored dashboard style and make the header sticky** so it stays on top while scrolling. Do you want me to do that?

<img
src="\assets\img\PennyGard.png" // replace with your actual logo path
style={{ width: 50, height: 50, objectFit: "contain", borderRadius:"30%" }}
/> add before trading dashboard header

Perfect! You can integrate your logo directly before the dashboard header like this:

TypeScript

```
<div style={{ display: "flex", alignItems: "center", gap: 12, marginBottom: 2(
  {/* Logo */}
  <img
    src="\assets\img\PennyGard.png"
    alt="PennyGard Trading Logo"
    style={{ width: 50, height: 50, objectFit: "contain", borderRadius: "30%"
  />
  {/* Dashboard Title */}
  <h1 style={{ color: "white", margin: 0 }}>🚀 Trading Dashboard</h1>
</div>
```

✅ **What this does:**

- Displays your **PennyGard logo** to the left of the title.
- The `borderRadius: "30%"` gives it slightly rounded corners.
- `gap: 12` keeps spacing between logo and text.

You just need to place this **at the top of your App component**, replacing the old header `<h1>🚀 Trading Dashboard</h1>`.

If you want, I can also **make the header more professional with a colored background bar** to make it stand out as a dashboard header. Do you want me to do that?

<div style={{ alignItems: "center" ,width:100%} }>
<div style={{ display: "flex", alignItems: "center", gap: 12,

```
marginBottom: 20 }}>
      {/* Logo */}
      <img
        src="src\assets\img\PennyGard.png"
        style={{ width: 50, height: 50, objectFit: "contain",
borderRadius: "30%" }}
      />
      {/* Dashboard Title */}
      <h1 style={{ color: "white", margin: 0 }}>PennyGard
Trading</h1>
    </div>
</div>
```

Perfect! That will render your **PennyGard logo to the left** of the “PennyGard Trading” header.

A couple of improvements to make it more polished:

TypeScript

```typescript
<div style={{ width: "100%", display: "flex", justifyContent: "center", margin
  <div style={{ display: "flex", alignItems: "center", gap: 12 }}>
    {/* Logo */}
    <img
      src="src/assets/img/PennyGard.png" // Use forward slashes
      alt="PennyGard Trading Logo"
      style={{ width: 50, height: 50, objectFit: "contain", borderRadius: "30%
    />
    {/* Dashboard Title */}
    <h1 style={{ color: "white", margin: 0, fontSize: 36 }}>PennyGard Trading
  </div>
</div>
```

✅ **Changes & Recommendations:**

1. Use **forward slashes** in the path: `src/assets/img/PennyGard.png`.
2. Added `justifyContent: "center"` so the header + logo are **centered horizontally**.
3. Set a larger font size `36px` for the header to make it more prominent.
4. Added `alt` text for accessibility.

This will look like a **clean, centered dashboard header** with your logo.

If you want, I can also **turn it into a colored header bar** spanning the full width of the dashboard for a more professional look. Do you want me to do that?

```
initially keep it unsorted  <Card style = {{ height: '100%' }}>
    <h3>📈 Trades</h3>
    <div style={{ marginBottom: 10 }}>
        Sort by:
        <select onChange={(e) =>
setSortKey(e.target.value)}>
            <option value="price">Price</option>
            <option value="symbol">Symbol</option>
            <option value="qty">Quantity</option>
        </select>
    </div>

    <table style={{ width: "100%" }}>
        <thead>
            <tr>
                <th>Symbol</th>
                <th>Side</th>
                <th>Price</th>
                <th>Qty</th>
                <th>Strategy</th>
            </tr>
        </thead>
        <tbody>
            {sortedTrades.map((t, i) => (
                <tr key={i}>
                    <td>{t.symbol}</td>
                    <td style={{ color: t.side === "BUY" ?
"#22c55e" : "#ef4444" }}>
                        {t.side}
                    </td>
                    <td>${t.price.toFixed(2)}</td>
                    <td>{t.quantity}</td>
                    <td>{t.strategy}</td>
                </tr>
            ))}
        </tbody>
    </table>
 </Card>
```

Got it! You want the **Trades table to initially show unsorted trades** instead of being sorted by price.

You can achieve this by **not applying any sorting until the user selects a sort option**. Here's the updated code:

TypeScript

```
<Card style={{ height: '100%' }}>
  <h3>📈 Trades</h3>

  <div style={{ marginBottom: 10 }}>
    Sort by:
    <select
      onChange={(e) => setSortKey(e.target.value)}
      value={sortKey || ""}
    >
      <option value="">None</option> {/* Initially unsorted */}
      <option value="price">Price</option>
      <option value="symbol">Symbol</option>
      <option value="qty">Quantity</option>
    </select>
  </div>

  <table style={{ width: "100%" }}>
    <thead>
      <tr>
        <th>Symbol</th>
        <th>Side</th>
        <th>Price</th>
        <th>Qty</th>
        <th>Strategy</th>
      </tr>
    </thead>
    <tbody>
      {(sortKey
        ? [...trades].sort((a, b) => {
            if (sortKey === "price") return b.price - a.price;
            if (sortKey === "symbol") return a.symbol.localeCompare(b.symbol);
            if (sortKey === "qty") return b.quantity - a.quantity;
            return 0;
          })
        : trades // unsorted initially
      ).map((t, i) => (
        <tr key={i}>
          <td>{t.symbol}</td>
          <td style={{ color: t.side === "BUY" ? "#22c55e" : "#ef4444" }}>
            {t.side}
          </td>
          <td>${t.price.toFixed(2)}</td>
          <td>{t.quantity}</td>
```

```
            <td>{t.strategy}</td>
          </tr>
        ))}
      </tbody>
    </table>
  </Card>
```

✅ **Key Changes:**

1. Added `<option value="">None</option>` so the user can see trades **unsorted initially**.
2. Conditional sorting: only sort if `sortKey` is selected. Otherwise, the table displays trades in the **original order**.

This keeps your dashboard intuitive—users see the raw order first and can sort if they want.

Do you want me to **highlight the header when sorted** for a more polished UI?

```
import { Line } from "react-chartjs-2";
const Card = ({ children }: any) => (
  <div style={{ background: "F0F8FF",padding: 16,
borderRadius: 12, boxShadow: "0 4px 10px
rgba(0,0,0,0.3)" }}>
    {children}
  </div>
);

export const EquityChart = ({ history }: any) => {
  if (!history || history.length === 0) return null; // hide if
null/empty

  return (
    <Card>
      <h3>📊 Equity Curve</h3>
      <Line style={{ width: "100%"} }
        data={{
          labels: history.map((_: any, i: number) => i),
          datasets: [{ label: "Equity", data: history }]
        }}
      />
    </Card>
```

```
  );
};
```

I see your `Card` background color is currently `"F0F8FF"`. It's missing the `#` prefix, so the color won't render correctly. Also, the `Line` chart width doesn't need `style={{ width: "100%" }}` — `react-chartjs-2` automatically fills the container.

Here's the corrected and polished version:

TypeScript

```typescript
import { Line } from "react-chartjs-2";

const Card = ({ children }: any) => (
  <div
    style={{
      background: "#F0F8FF", // added # for valid color
      padding: 16,
      borderRadius: 12,
      boxShadow: "0 4px 10px rgba(0,0,0,0.3)"
    }}
  >
    {children}
  </div>
);

export const EquityChart = ({ history }: any) => {
  if (!history || history.length === 0) return null; // hide if null/empty

  return (
    <Card>
      <h3>📊 Equity Curve</h3>
      <Line
        data={{
          labels: history.map((_: any, i: number) => i),
          datasets: [
            {
              label: "Equity",
              data: history,
              borderColor: "#22c55e", // green line
              backgroundColor: "rgba(34,197,94,0.2)", // light fill
              tension: 0.3 // smooth curve
            }
          ]
        }}
        options={{
          responsive: true,
          plugins: {
            legend: {
```

```
              display: true
            }
          },
          scales: {
            x: { title: { display: true, text: "Time" } },
            y: { title: { display: true, text: "Equity ($)" } }
          }
        }}
      />
    </Card>
  );
};
```

✅ **Improvements:**

1. Added `#` to `#F0F8FF` so background shows.
2. Styled the equity line and fill for better visuals.
3. Added `tension: 0.3` for a smooth curve.
4. Added x/y axis titles.

If you want, I can **update all charts (PriceChart, etc.) with the same styled Card + smooth curves + colored lines** so the whole dashboard looks consistent. Do you want me to do that?

it should take flex-2 whole width of dashboard

Got it! You want the **EquityChart Card to stretch and fill the entire left column** (flex-2) in your dashboard layout.

Here's how to do it:

TypeScript

```
<div style={{ flex: 2, display: "flex", flexDirection: "column", gap: 16 }}>
  {/* Symbol Selector and Portfolio */}
  <SymbolSelector symbols={symbols} setSymbols={setSymbols} />
  <PortfolioSummary portfolio={portfolio} />
  <PositionsGrid positions={portfolio?.positions} />

  {/* Equity Chart stretched to full width of left column */}
  {equityHistory && equityHistory.length > 0 && (
    <div style={{ width: "100%" }}>
      <EquityChart history={equityHistory} />
```

```
      </div>
    )}

    {/* Price Charts */}
    {Object.keys(priceHistory || {}).map(symbol => (
      <PriceChart
        key={symbol}
        symbol={symbol}
        data={priceHistory[symbol]}
      />
    ))}
  </div>
```

✅ **Key Points:**

1. Wrap `EquityChart` in a `<div style={{ width: "100%" }}>` so it **fills the flex-2 column**.
2. The Card inside `EquityChart` already stretches to its container by default.
3. Left column (`flex: 2`) ensures it takes **twice the width of the trades column**.

If you want, I can **make all charts in the left column automatically stretch full width** for a uniform dashboard look. Do you want me to do that?

```
<div style={{ display: "grid", gridTemplateColumns: "repeat(auto-fit, minmax(400px, 1fr))", gap: 16, width: "100%" ,background:"white"}}>
    {Object.keys(priceHistory || {}).map(symbol => (
        <PriceChart key={symbol} symbol={symbol} data={priceHistory[symbol]} />
    ))}
</div>

import { Line } from "react-chartjs-2";

export const PriceChart = ({ data, symbol }: any) => {
  return (
    <div>
      <h4>{symbol} Price</h4>
      <Line
        data={{
          labels: data.map((_: any, i: number) => i),
          datasets: [{ label: symbol, data }]
        }}
```

```
      />
    </div>
  );
};
```

I see! You're currently using a **CSS grid** to display multiple `PriceChart` components, but each chart's container is not styled as a Card or stretching properly. We can improve this so:

- Each chart is in a **Card** with padding and background.
- Charts fill their grid cell (`width: 100%`).
- Grid remains responsive with `minmax(400px, 1fr)`.

Here's the updated version:

TypeScript

```typescript
<div
  style={{
    display: "grid",
    gridTemplateColumns: "repeat(auto-fit, minmax(400px, 1fr))",
    gap: 16,
    width: "100%",
    background: "white",
    padding: 16,
    borderRadius: 12
  }}
>
  {Object.keys(priceHistory || {}).map((symbol) => (
    <div key={symbol} style={{ width: "100%" }}>
      <PriceChart symbol={symbol} data={priceHistory[symbol]} />
    </div>
  ))}
</div>
```

And update `PriceChart` to use a **Card wrapper** for consistent styling with EquityChart:

TypeScript

```typescript
import { Line } from "react-chartjs-2";

const Card = ({ children }: any) => (
  <div
    style={{
      background: "#F0F8FF",
      padding: 16,
      borderRadius: 12,
      boxShadow: "0 4px 10px rgba(0,0,0,0.3)",
```

```
      width: "100%"
    }}
  >
    {children}
  </div>
);

export const PriceChart = ({ data, symbol }: any) => {
  return (
    <Card>
      <h4>{symbol} Price</h4>
      <Line
        data={{
          labels: data.map((_: any, i: number) => i),
          datasets: [
            {
              label: symbol,
              data,
              borderColor: "#3b82f6",
              backgroundColor: "rgba(59, 130, 246, 0.2)",
              tension: 0.3
            }
          ]
        }}
        options={{ responsive: true }}
      />
    </Card>
  );
};
```

✅ **Benefits:**

- Each price chart is in a styled card for visual consistency.
- Grid is responsive, so smaller screens stack charts automatically.
- Charts stretch to **fill the grid cell**.

If you want, I can **merge this grid with the left column flex-2 layout** so **EquityChart + all PriceCharts take the full left width**, making the dashboard look uniform. Do you want me to do that?

```
<div
  style={{
    display: "grid",
    gridTemplateColumns: "repeat(auto-fit, minmax(400px, 1fr))",
    gap: 16,
```

```
        width: "100%",
    }}
 >
    {Object.keys(priceHistory || {}).map((symbol) => (
        <div key={symbol} style={{ width: "100%" }}>
            <PriceChart symbol={symbol} data=
{priceHistory[symbol]} />
        </div>
    ))}
 </div>
```

each grid should be one after another not overlapping side by side

Ah! I see exactly what you want — you **don't want a responsive multi-column grid**; you want **each** `PriceChart` **to stack vertically, one after another**, taking full width.

You can simply replace the CSS grid with a **flex column or block layout**:

TypeScript

```typescript
<div
  style={{
    display: "flex",
    flexDirection: "column",
    gap: 16,
    width: "100%"
  }}
>
  {Object.keys(priceHistory || {}).map((symbol) => (
    <div key={symbol} style={{ width: "100%" }}>
      <PriceChart symbol={symbol} data={priceHistory[symbol]} />
    </div>
  ))}
</div>
```

✅ **What changed:**

1. `display: flex; flex-direction: column;` → stacks charts vertically.
2. `gap: 16` → space between each chart.
3. `width: 100%` → each chart stretches full width of the container.

This will make **each PriceChart appear below the previous one**, no side-by-side overlap.

If you want, I can also **wrap them in the Card styling so all charts have a consistent dashboard look** while stacking vertically. Do you want me to do that?

```
<Card style = {{ height: '70vh' }}>
  <h3>📈 Trades</h3>
  <div style={{ marginBottom: 10 }}>
    Sort by:
    <select onChange={(e) => setSortKey(e.target.value)}
      value={sortKey||""}>
      <option value="price">Price</option>
      <option value="symbol">Symbol</option>
      <option value="qty">Quantity</option>
    </select>
  </div>

  <table style={{ width: "100%" }}>
    <thead>
      <tr>
        <th>Symbol</th>
        <th>Side</th>
        <th>Price</th>
        <th>Qty</th>
        <th>Strategy</th>
      </tr>
    </thead>
    <tbody>
      {sortedTrades.map((t, i) => (
        <tr key={i}>
          <td>{t.symbol}</td>
          <td style={{ color: t.side === "BUY" ?
"#22c55e" : "#ef4444" }}>
            {t.side}
          </td>
          <td>${t.price.toFixed(2)}</td>
          <td>{t.quantity}</td>
          <td>{t.strategy}</td>
        </tr>
      ))}
    </tbody>
  </table>
```

</Card>
allow max 100 row then add new page for this table

Great idea — pagination is exactly what you need here 👍

You want:

- Max **100 rows per page**
- Navigation to **next/previous pages**

✅ Step 1: Add Pagination State

TypeScript

```typescript
const [currentPage, setCurrentPage] = useState(1);
const rowsPerPage = 100;
```

✅ Step 2: Slice Data for Current Page

TypeScript

```typescript
const totalPages = Math.ceil(sortedTrades.length / rowsPerPage);

const paginatedTrades = sortedTrades.slice(
  (currentPage - 1) * rowsPerPage,
  currentPage * rowsPerPage
);
```

✅ Step 3: Use Paginated Data in Table

Replace:

TypeScript

```typescript
{sortedTrades.map(...)}
```

with:

TypeScript

```
{paginatedTrades.map((t, i) => (
  <tr key={i}>
    <td>{t.symbol}</td>
    <td style={{ color: t.side === "BUY" ? "#22c55e" : "#ef4444" }}>
      {t.side}
    </td>
    <td>${t.price.toFixed(2)}</td>
    <td>{t.quantity}</td>
    <td>{t.strategy}</td>
  </tr>
))}
```

✅ Step 4: Add Pagination Controls

Add this **below your table**:

TypeScript

```
<div style={{ marginTop: 12, display: "flex", justifyContent: "center", gap: 1
  <button
    onClick={() => setCurrentPage(prev => Math.max(prev - 1, 1))}
    disabled={currentPage === 1}
  >
    ⬅ Prev
  </button>

  <span style={{ color: "white" }}>
    Page {currentPage} of {totalPages}
  </span>

  <button
    onClick={() => setCurrentPage(prev => Math.min(prev + 1, totalPages))}
    disabled={currentPage === totalPages}
  >
    Next ➡
  </button>
</div>
```

🔥 Bonus (Important UX Fix)

Reset page when sorting changes:

TypeScript

```
onChange={(e) => {
  setSortKey(e.target.value);
```

```
  setCurrentPage(1); // reset to first page
}}
```

🎯 Result

- Only **100 trades per page**
- Smooth navigation
- Works with sorting
- Prevents UI lag with large datasets

If you want next-level polish, I can add:
👉 Page numbers (1, 2, 3…)
👉 Jump to page
👉 Infinite scroll (like real trading apps)

Just tell me 👍

```
import  { useState } from "react";

const Card = ({ children }: any) => (
   <div style={{ background: "#1e293b", color: "white",
padding: 16, borderRadius: 12, boxShadow: "0 4px 10px
rgba(0,0,0,0.3)" }}>
      {children}
   </div>
);
// Types
interface Trade {
   symbol: string;
   side: "BUY" | "SELL";
   price: number;
   quantity: number;
   strategy: string;
}
export const TradesTable = ({ trades }: { trades: Trade[] })
=> {
   const [sortKey, setSortKey] = useState<string>("price");
```

```
    const sortedTrades = [...(trades || [])].sort((a: any, b: any)
=> {
        if (sortKey === "price") return b.price - a.price;
        if (sortKey === "symbol") return
a.symbol.localeCompare(b.symbol);
        if (sortKey === "qty") return b.quantity - a.quantity;
        return 0;
    });

    return (
        <Card style = {{ height: '70vh' }}>
            <h3>📈 Trades</h3>
            <div style={{ marginBottom: 10 }}>
                Sort by:
                <select onChange={(e) =>
setSortKey(e.target.value)}
                    value={sortKey||""}>
                    <option value="price">Price</option>
                    <option value="symbol">Symbol</option>
                    <option value="qty">Quantity</option>
                </select>
            </div>

            <table style={{ width: "100%" }}>
                <thead>
                    <tr>
                        <th>Symbol</th>
                        <th>Side</th>
                        <th>Price</th>
                        <th>Qty</th>
                        <th>Strategy</th>
                    </tr>
                </thead>
                <tbody>
                    {sortedTrades.map((t, i) => (
                        <tr key={i}>
                            <td>{t.symbol}</td>
                            <td style={{ color: t.side === "BUY" ?
"#22c55e" : "#ef4444" }}>
                                {t.side}
                            </td>
                            <td>${t.price.toFixed(2)}</td>
                            <td>{t.quantity}</td>
```

```
                <td>{t.strategy}</td>
              </tr>
            ))}
          </tbody>
        </table>
      </Card>
    );
  };
```

Nice setup 👍 — let's upgrade your existing component with **pagination (100 rows per page)** while keeping everything clean.

✅ Updated `TradesTable` with Pagination

TypeScript

```typescript
import { useState } from "react";

const Card = ({ children }: any) => (
  <div
    style={{
      background: "#1e293b",
      color: "white",
      padding: 16,
      borderRadius: 12,
      boxShadow: "0 4px 10px rgba(0,0,0,0.3)"
    }}
  >
    {children}
  </div>
);

// Types
interface Trade {
  symbol: string;
  side: "BUY" | "SELL";
  price: number;
  quantity: number;
  strategy: string;
}

export const TradesTable = ({ trades }: { trades: Trade[] }) => {
  const [sortKey, setSortKey] = useState<string>("price");
  const [currentPage, setCurrentPage] = useState(1);

  const rowsPerPage = 100;
```

```
const sortedTrades = [...(trades || [])].sort((a, b) => {
  if (sortKey === "price") return b.price - a.price;
  if (sortKey === "symbol") return a.symbol.localeCompare(b.symbol);
  if (sortKey === "qty") return b.quantity - a.quantity;
  return 0;
});

// Pagination logic
const totalPages = Math.ceil(sortedTrades.length / rowsPerPage);

const paginatedTrades = sortedTrades.slice(
  (currentPage - 1) * rowsPerPage,
  currentPage * rowsPerPage
);

return (
  <Card>
    <h3>📈 Trades</h3>

    <div style={{ marginBottom: 10 }}>
      Sort by:
      <select
        onChange={(e) => {
          setSortKey(e.target.value);
          setCurrentPage(1); // reset page on sort
        }}
        value={sortKey || ""}
      >
        <option value="price">Price</option>
        <option value="symbol">Symbol</option>
        <option value="qty">Quantity</option>
      </select>
    </div>

    {/* Scrollable table */}
    <div style={{ maxHeight: "60vh", overflowY: "auto" }}>
      <table style={{ width: "100%" }}>
        <thead>
          <tr>
            <th>Symbol</th>
            <th>Side</th>
            <th>Price</th>
            <th>Qty</th>
            <th>Strategy</th>
          </tr>
        </thead>
        <tbody>
          {paginatedTrades.map((t, i) => (
            <tr key={i}>
              <td>{t.symbol}</td>
              <td
```

```
                    style={{
                      color: t.side === "BUY" ? "#22c55e" : "#ef4444"
                    }}
                  >
                    {t.side}
                  </td>
                  <td>${t.price.toFixed(2)}</td>
                  <td>{t.quantity}</td>
                  <td>{t.strategy}</td>
                </tr>
              ))}
            </tbody>
          </table>
        </div>

        {/* Pagination Controls */}
        <div
          style={{
            marginTop: 12,
            display: "flex",
            justifyContent: "center",
            gap: 12
          }}
        >
          <button
            onClick={() => setCurrentPage((p) => Math.max(p - 1, 1))}
            disabled={currentPage === 1}
          >
            ⬅ Prev
          </button>

          <span>
            Page {currentPage} / {totalPages || 1}
          </span>

          <button
            onClick={() =>
              setCurrentPage((p) => Math.min(p + 1, totalPages))
            }
            disabled={currentPage === totalPages || totalPages === 0}
          >
            Next ➡
          </button>
        </div>
      </Card>
    );
  };
```

🚀 What You Get

- ✅ Max **100 rows per page**
- ✅ Smooth pagination (Prev / Next)
- ✅ Scrollable table inside card
- ✅ Page resets when sorting changes
- ✅ Prevents UI lag with large datasets

🔥 Optional (If you want to go pro level)

I can help you add:

- Page numbers (1, 2, 3…)
- Jump to page input
- Server-side pagination (real-world scalable)
- Sticky table header (very useful)

Just tell me 👍
